Preface	3	7. Cell wall structure and Properties	49
CELC is dedicated to creating a competitive environment for industry	5	8. Testing and Standards	54
ADEME, the French Environment and Energy Management Agency	7	9. Fibres and Composites	56
Contributor, the European Scientific Committee of CELC	11	10. Acknowledgement	58
I – A general introduction to composites, highlighting the advantages of Flax and Hemp composites	15	11. Literature	58
1. Designing (with) materials	15	III – Architecture of textile reinforcements and properties of composites	61
2. Materials and functionality	16	1. Importance of crimp for composites	64
3. Why is weight important?	19	2. Importance of twist for composites	66
4. Strong, stiff and light	20	3. Influence of twist on mechanical properties	67
5. Natural fibres, another Darwin product	21	4. Influence of twist on the amount of crimp	68
6. Can I knit an aircraft, or a chair?	25	5. Influence of twist on impregnation	69
7. The composite concept	26	6. Conclusion	70
8. The orientation effect	30	7. References	70
9. Textile: an old technology for advanced materials	33	IV – Matrix polymers	71
10. Some economical aspects	34	1. Introduction	71
II – Reinforcements: fibres	39	2. Role of the matrix in a composite material	72
1. Introduction	39	3. Polymers: what are they?	74
2. Types of fibres	39	4. Polymer families: relationships between structure, manufacturing and properties	77
3. Arrangements in plants	39	5. Examples of polymers reinforced with natural fibres	81
4. Chemistry of plant Fibres	42	6. Aging and long-term performance	84
5. Decortication and Separation	43	7. End-of-life recycling, incineration or biodegradation	84
6. Fibre morphology	46	V – Semi-products with Flax and Hemp fibres	87
		1. Preforms	88
		2. Pre-impregnated preforms	93
		3. Conclusion	96

VI – Production techniques for natural fibre polymer composites	99	11. Home improvement	159
1. Thermoplastic composites	100	12. Design	161
2. Semi-product composites (granulates)	102	IX – Eco-design, Life Cycle Analysis (LCA) and Recycling	163
3. Effect of the production technique on the granulate	105	1. Introduction	163
4. Direct product thermoplastic composites	106	2. Ecosystems	163
5. Thermosetting composites	108	3. Eco-design	165
6. Acknowledgement	117	4. Life cycle analysis	166
7. References	117	5. Recycling	174
VII – Properties of Flax and Hemp composites	119	6. Conclusion	178
1. Cellulose fibres	119	7. References	178
2. Cellulose fibre composites	121	X – Availability and accessibility of Flax and Hemp for use as materials	181
3. Mechanical properties: stiffness and strength	121	1. Flax and Hemp: the leading plant fibres in Europe	181
4. Physical properties: density	123	2. A well-organised industry	182
5. Chemical properties: moisture absorption	124	3. Maturity of the European Flax/Hemp industry	182
6. Mechanical properties relative to density	126	4. Getting the most out of Flax and Hemp fibres	183
7. Composites with short fibres	127	5. An available resource: France as an example	184
8. Composites with non-aligned fibres	128	6. Increasing yields	186
9. Composites with off-axis loading	129	7. Secure supply	186
10. Composite fracture energy	129	8. Production and supply capacities in line with demand outlook: the example of France	187
11. Composites with porosity	132	9. Reference	188
12. Optimal composites	135	XI – Keywords on natural fibre composites	189
13. Practical composites	135	APPENDIX I	201
14. Technical and environmental aspects	140	Other technical applications of Flax and Hemp	201
15. Concluding remarks	140	APPENDIX II	207
VIII – Flax & Hemp composites applications	141	Flax and Hemp growing, an ecological bonus	207
1. Automotive	141		
2. Mobility and transport	146		
3. Perspectives / Aerospace	148		
4. Prospects / Railway	149		
5. Sports and leisure	149		
6. Boating	152		
7. Packaging	154		
8. Convenience goods	155		
9. Street furniture	157		
10. Wind energy	159
